

ABSTRACT OF THE INVENTION

A system and method of displaying data representing an object of a class where the class has one or more attributes and each object has an attribute value associated with each attribute. The invention includes a collection class such that each statistic to be monitored is represented as an object of the class. The invention allows a software application to access the objects in a database. The invention provides a user interface (UI) attribute within the class that allows the user to specify the UI to display the attribute values of each accessed object. Each available UI is customized to a statistic to be monitored. Each available UI has a unique user interface attribute value. The invention supports any number of UIs supplied by the user, an application developer, or a third party.
